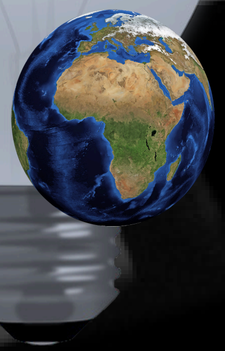
ANOTHER WAY

POWER OF 10

PRESENTS...

E- WASTE QUICK FACT FILE

There are enough unused cables in UK households to go around the world 5 times



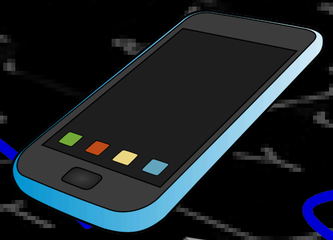
40 million tonnes of e-waste is generated globally each year - the equivalent to throwing out 800 laptops per second

Refurbished laptops produce 93% less CO2 emissions than new laptops do

An average of 20 unused electronic items are in every UK home

Recycling e-waste could save 1.5 million tonnes of CO2 each year (UK alone)

Over 1 billion new phones produced every year



A one-hour video call can emit 1kg of CO2

£14 billion worth of valuable metals and resources are wasted each year through discarded e-waste

The average phone user replaces their phone every 18 months

Remanufacturing laptops reuses 99% of the existing materials

By keeping your phone for 4 years instead of 2, you can halve its carbon footprint

Turning your camera off when calling, or simply phoning someone instead of video calling can reduce emissions by up to 96%
